Subject: Request for Data Analysis Support: 2021-2022 Road Accident Insights Dashboard

Hi Esteban,

We are currently looking into our historical road safety records for the years 2021 and 2022 to better optimize emergency response allocation and identify critical risk areas. We need a clean, interactive dashboard built to give our team clear insights into our accident records. Since our committee relies heavily on spreadsheet tools, we would prefer this tracking system to be developed entirely within Excel.

Specifically, we need you to address the following requirements from the data:

- **Core KPIs:** First and foremost, we need a clear KPI card showing the total number of casualties recorded after an accident occurs. Alongside this, we must see how these casualties break down by severity (Fatal, Serious, and Slight) along with their respective percentages of the total.
- **Vehicle Segmentations:** We want to know which vehicle types contribute most to these numbers. Please identify which vehicle type records the absolute maximum number of casualties, and provide a comprehensive distribution of casualties across all vehicle categories.
- **Temporal & Trend Analysis:** We need a visual monthly trend chart for tracking performance over time. Please set up a monthly timeline comparison that matches our Current Year (CY) metrics directly against the Previous Year (PY) numbers so we can identify seasonal spikes.
- **Environmental Factors:** To support infrastructure modifications, please analyze how casualties behave under different settings. We need to see the maximum casualty distributions grouped by different *Road Types*, as well as a breakdown across various *Road Surfaces* (dry, wet, etc.).
- **Contextual Relations:** Finally, we want to look at the intersection of geography and time. Please evaluate the structural relationship between casualties when looking at the Area/Location type (Urban vs. Rural) against the time of day (Day vs. Night).

Please ensure that the final workbook is highly visual, easy to filter, and clean so the leadership team can interact with it seamlessly.

Best regards,

Operations Safety Committee
